# Exercise 3 in Cryptography <br> - Proposed Solution - 

Prof. Dr. Rudolf Mathar, Henning Maier, Jose Angel Leon Calvo
2015-04-30

## Solution of Problem 7

The first step is to perform a frequency analysis. The frequency analysis consists of counting the number of appearances of each letter and the number of ordered pairs as follows:

| i | Character | $k_{i}$ | $p_{i}$ |
| :---: | :---: | :---: | :---: |
| 0 | A | 1 | 0 |
| 1 | B | 4 | 6 |
| 2 | C | 12 | 66 |
| 3 | D | 4 | 6 |
| 4 | E | 2 | 1 |
| 5 | F | 1 | 0 |
| 6 | G | 6 | 15 |
| 7 | H | 2 | 1 |
| 8 | I | 7 | 21 |
| 9 | J | 2 | 1 |
| 10 | K | 14 | 91 |
| 11 | L | 7 | 21 |
| 12 | M | 1 | 0 |

| i | Character | $k_{i}$ | $p_{i}$ |
| :---: | :---: | :---: | :---: |
| 13 | N | 3 | 3 |
| 14 | O | 4 | 6 |
| 15 | P | 4 | 6 |
| 16 | Q | 4 | 6 |
| 17 | R | 10 | 45 |
| 18 | S | 4 | 6 |
| 19 | T | 0 | 0 |
| 20 | U | 0 | 0 |
| 21 | V | 9 | 36 |
| 22 | W | 6 | 15 |
| 23 | X | 8 | 28 |
| 24 | Y | 3 | 3 |
| 25 | Z | 0 | 0 |

- $k_{i}$ the total number of ocurrences of each letter
- $p_{i}$ the number of ordered pairs calculated as $p_{i}=\binom{k_{i}}{2}$

The next step is to calculate the total length of the ciphertext using that the text is divided in blocks:

$$
\begin{equation*}
n=14 \cdot 8+6=118 \tag{1}
\end{equation*}
$$

Now we have to use the formula of the index of coincidence as follows (Def: 3.1, page 13, lecture notes):

$$
\begin{equation*}
I_{C}=\frac{\left.|\{i, j\}| C_{i}=C_{j}, 1 \leq i<j \leq n\right\} \mid}{\binom{n}{2}}=\frac{\sum_{i=0}^{25}\left(\frac{k_{i}}{2}\right)}{\binom{n}{2}} \tag{2}
\end{equation*}
$$

For 2, we calculate all the possible pair of combinations of $n$ symbols as:

$$
\begin{equation*}
\binom{n}{2}=\frac{n!}{(n-2)!2!}=\frac{n(n-1)}{2!}=\frac{118 \cdot 117}{2}=6903 \tag{3}
\end{equation*}
$$

Therefore, substituting in 2, we have:

$$
\begin{gather*}
I_{C}=\frac{6 \cdot 0+3 \cdot 1+2 \cdot 3+6 \cdot 6+2 \cdot 15+2 \cdot 21+1 \cdot 28+1 \cdot 36+1 \cdot 45+1 \cdot 66+1 \cdot 91}{6093} \\
=\frac{383}{6903}=0.055483 \tag{4}
\end{gather*}
$$

Using the hint of the exercise, we can assume that the text is monoalphabetic and probably in English, because the index of coincidence obtained is close to its value.

## Solution of Problem 8

a) We have the auto-key cryptosystem:

$$
c_{i}=\left\{\begin{array}{lll}
m_{i}+k_{i} & (\bmod 26) & 0 \leq i \leq n-1 \\
m_{i}+c_{i-n} & (\bmod 26) & n \leq i \leq l-1
\end{array}\right.
$$

Using a ciphertext only attack, we can compute the message as follows:

$$
\begin{gathered}
c_{n}=m_{n}+c_{0} \Longleftrightarrow m_{n}=c_{n}-c_{0} \\
c_{n+1}=m_{n+1}+c_{1} \Longleftrightarrow m_{n+1}=c_{n+1}-c_{1} \\
\Longrightarrow m_{n+j}=c_{n+j}-c_{j}
\end{gathered}
$$

Therefore, the next task is to determine $n$
b) Using the result from a) we decipher the following text, just shifting the ciphertext along itself:

For $n=1$

| D | L | G | V | T | Y | O | A | C | O | U | V | C | E | Z | A |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D | L | G | V | T | Y | O | A | C | O | U | V | C | E | Z | A |
|  | I | V | P |  |  |  |  |  |  |  |  |  |  |  |  |  |

For $n=2$

| D | L | G | V | T | Y | O | A | C | O | U | V | C | E | Z | A |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | D | L | G | V | T | Y | O | A | C | O | U | V | C | E | Z | A |
|  |  | D | K | N |  |  |  |  |  |  |  |  |  |  |  |  |  |

For $n=3$

| D | L | G | V | T | Y | O | A | C | O | U | V | C | E | Z | A |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | D | L | G | V | T | Y | O | A | C | O | U | V | C | E | Z | A |
|  |  |  | S | I | S | T | H | E | A | U | T | O | K | E | Y |  |  |  |

Only the first characters are missing in the message. For these characters, we guess them. Message: THIS IS THE AUTOKEY
c) Consider:

$$
\hat{c}_{i}=\left\{\begin{array}{ll}
m_{i}+k_{i} \quad(\bmod 26) & 0 \leq i \leq n-1 \\
m_{i}+m_{i-n} & (\bmod 26)
\end{array} \quad n \leq i \leq l-1 .\right.
$$

In this case, we know the keylength $n$ and the message $m$. Therefore, we can obtain the message by:

$$
\begin{equation*}
c_{i}=m_{i}+m_{i-n} \tag{5}
\end{equation*}
$$

With a Friedmann attack, using the most common characters in the English language, the message can be deciphered with a high probability
d)

| Q | E | X | Y | I | R | V | E | S | I | U | X | X | K | Q | V | F | L | H | K | G |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| T |  | E |  | E |  | R |  | B |  | T |  | E |  | M |  | T |  | O |  | S |
|  | H |  | R |  | A |  | E |  | E |  | T |  | R |  | E |  | H |  | D |  |

The plaintext is: THERE ARE BETTER METHODS

## Solution of Problem 9

In this exercise, we have to apply the Kasiski-Babbage method as follows:

$$
Y_{i j}= \begin{cases}1 & \text { if } c_{i}=c_{j} \\ 0 & \text { else }\end{cases}
$$

then

$$
\mathrm{E}\left[Y_{i j}\right]= \begin{cases}k_{m} & \text { if } c_{i}=c_{j} \\ \frac{1}{m} & \text { else }\end{cases}
$$

It follows for $m=26$ (using English language):

$$
\begin{equation*}
k=\frac{0.028433 n}{(n-1) I_{C}-0.0385 n+0.066895} \tag{6}
\end{equation*}
$$

In our case, the length of the message is $n=3568$. Therefore, $k \approx 6.25643$. The length of the key has to be an integer, $k \approx 6$. We use the hint at the beginning of the exercise, getting $k \approx 5$.

Once we have the keylength, we perform a frequency analysis of the ciphertext. We create a frequency analysis for each of the 5 columns of the ciphertext. As we know, the most common characters in English language are: E, T, A, O, I, N.

The frequency analysis in detail is as follows:

| Block | Character | Frequency | Char | Frequency | Char | Frequency |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | T | 89 | I | 68 | P | 61 |
| $\mathbf{2}$ | P | 103 | E | 69 | T | 56 |
| $\mathbf{3}$ | Y | 94 | N | 63 | C | 58 |
| $\mathbf{4}$ | X | 101 | B | 59 | G | 53 |
| $\mathbf{5}$ | S | 85 | H | 68 | B | 58 |

Once this analysis is finished. We map the most common character to the character E, the second to T and we do the same with the following. Using this method, we obtain the key: Key $=(\mathrm{T} \rightarrow \mathrm{E}, \mathrm{P} \rightarrow \mathrm{E}, \mathrm{Y} \rightarrow \mathrm{E}, \mathrm{X} \rightarrow \mathrm{E}, \mathrm{S} \rightarrow \mathrm{E})=\mathrm{PLUTO}$

Using this key to decipher the ciphertext, the first sentence of the message is: THE BLACK CAT THE MOST WILD YET THE MOST HOMELY NARRATIVE WHICH I AM ABOUT
